

Aortic Aneurysm Surgery

Surgery needs to be undergone as emergency treatment when aneurysm has ruptured or torn. Some type of surgeries to overcome aortic aneurysm are :

- 1. Open Surgery, this surgery is undergone by removing part of bubbled aortic then replace it with graft vessel.**
- 2. Endovascular Surgery, this surgery is undergone by inserted the stent in part of aneurysm by using catheter. The function of the stent is to strengthen weak aorta and prevent the rupture of blood vessel.**
